Re: Indirakumar Rajendiran — contribution to enterprise rate-management modernization

I am Karthick kumar Kalimuthu, Manager at Cognizant Technology Solutions. I worked with Indirakumar Rajendiran as project manager from 02/2019 to 09/2020. I have direct knowledge of Rate Maker Engine, and I can confirm the facts below to the extent stated.

Business context. The application used for enterprise freight-rating and rate-management platform supporting shipment cost calculations, contract-based rating rules and related operational workflows. This is a key tool used in the freight payment process for supporting invoice audits and freight accruals.

Legacy state and challenge. At 03/2019, the project scope involved complex geographical and mileage exceptions, all currencies, all rate types and accessorial charges. Rating shipments is crucial for achieving accurate invoice audits on a legacy IBM AS/400 platform. Business rules were embedded in older system components, creating challenges for integration and maintainability. The modernization had to preserve calculation accuracy and continuity of operations. The Engine is used to process 35 million freight invoices per year with greater than 15000 freight carriers payment network.

Personal design contribution and decision. On 04/26/2019, Indirakumar obtained approval for Global Rating Engine. He recommended rating rules, tech dependencies, coexistence and interfaces. His recommendation improved integration risk, resilience and maintainability. The design of his authorship and approval are recorded in design record.

Adoption and operational change. Chief Architect from client approved this design approach on 05/2019. Implementation team deployed it for approved platform function on 09/2019, supported by Architecture diagram.

I confirm that the information provided in this statement is based on my direct professional experience.

Yours faithfully,

K. Karthick
